

OOPs: Class

Simple answer, layman analogy, and a tiny Python example.

1. Class

Simple answer	A class is a blueprint or plan for creating objects.	
Analogy	Think of a house blueprint. The blueprint is not a real house, but it tells us how to build many houses.	
Example	A Car class can describe common things every car has: color, brand, speed, and actions like start or stop.	
Python		<pre>class Car: def __init__(self, brand, color): self.brand = brand self.color = color</pre>
