

OOPs: Abstraction

Simple answer, layman analogy, and a tiny Python example.

4. Abstraction

Simple answer	Abstraction means showing only what is necessary and hiding the complicated details.	
Analogy	When you drive a car, you use steering, brakes, and accelerator. You do not need to know every engine detail.	
Example	A payment app shows a Pay button, but hides banking, verification, and server work.	
Python		<pre>class Payment: def pay(self, amount): print("Payment processed")</pre>
