

OOPs: Constructor

Simple answer, layman analogy, and a tiny Python example.

7. Constructor

Simple answer	A constructor is a special method that runs automatically when an object is created.	
Analogy	When you buy a new phone, basic setup starts before you use it. A constructor does initial setup for an object.	
Example	In Python, <code>__init__</code> sets starting values like name, age, or brand.	
Python		<pre>class Student: def __init__(self, name): self.name = name</pre>
