

OOPs: Attribute

Simple answer, layman analogy, and a tiny Python example.

9. Attribute

Simple answer	An attribute is a value or property that belongs to an object.	
Analogy	A person has name, age, height, and address. These are like attributes.	
Example	A Student object can have name, roll_number, and marks.	
Python		<pre>student.name = "Asha" student.marks = 90</pre>
